CIRCUIT DESCRIPTION

Outline

This device is a dual-band 144/430MHz FM car transceiver planned and designed for amateur radio communications and has the following features.

1. Has a built-in TNC which conforms to the AX.25 protocol. With a portable computer, allows you to enjoy Packet operation quite easily.
2. Includes a program for dealing with data formats supported by Automatic Packet/ Position Reporting System (APRS®).
3. Is capable of receiving packet data on one band while receiving audio on another band.
4. Enhanced Programmable Memory (PM) channels store virtually entire current operating environments for your quick recall.
5. Contains a total of 200 memory channels to program frequencies and other various data. Allows each memory channel to be named using up to 8 alphanumeric and special ASCII characters.
6. "Visual Scan" graphically and simultaneously shows the conditions of up to 181 frequency channels.
7. Continuous Tone Coded Squelch System (CTCSS) or Digital Code Squelch (DCS) rejects unwanted calls from other stations.
8. The separate front panel can be mounted in a convenient different place from the main unit.
9. Equipped with an easy-to-read large LCD with alphanumeric display capability.
10. Enhances the functions of an optional VC-H1 Interactive Visual Communicator designed for plug-and-play color slow-scan television (SSTV).
11. Utilizes Sky Command System II designed to control a KENWOOD HF transceiver at a remote location (U.S.A./ Canada only).

CIRCUIT DESCRIPTION

1. Frequency configuration

The TM-D700 has an individual VCO and PLL unit for both VHF and UHF bands. Using these separate VCO and PLL circuit, it can receive 2 separate bands at the same time. Also, you can perform the full-duplex operation.

The VHF VCO is used for the following functions:

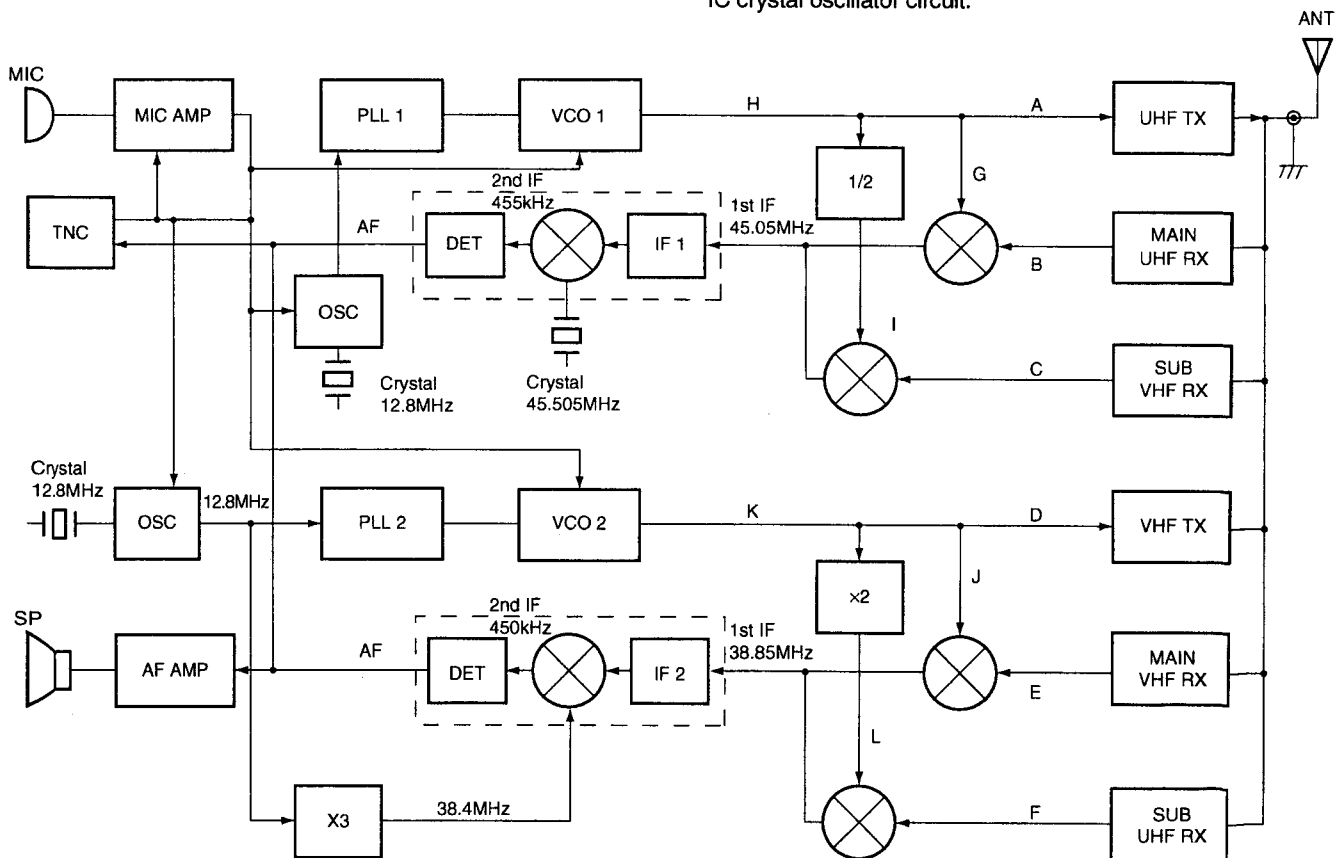

- (i) VHF transmission
- (ii) The first local oscillator for the main band(VHF) reception.
- (iii) The first local oscillator for the sub band(UHF) reception(doubled).

The UHF VCO is used for the following functions:

- (i) UHF transmission
- (ii) The first local oscillator for the main band(UHF) reception.
- (iii) The first local oscillator for the sub band(VHF) reception(halved).

The PLL reference frequency is generated by a 12.8MHz crystal oscillator connected to the VHF and UHF PLL ICs. This reference frequency is used for both PLL circuits.

The second local oscillator for the VHF band uses the tripled 12.8MHz reference oscillator frequency. The 45.05MHz second local oscillator for the UHF band is generated by the IF IC crystal oscillator circuit.

Fig.1 Frequency configuration

TM-D700A/E

CIRCUIT DESCRIPTION

2. Receiver system

2-1. Main VHF Receiver

The incoming signal from the antenna passes through a filter circuit and goes to the RF amplifier (Q205). The amplified signal enters the helical resonator (L209, L207, L204). The helical resonator is tuned to the desired frequency according to the BPF voltage output from the CPU with the varicap (D206, D205, D202). After the signal passes through a filter, it is amplified by another RF amplifier (Q202) and goes to the single balanced mixer (Q200, Q201). The frequency of the

signal is converted by the first local oscillator (Upper heterodyne) to generate a 38.85MHz first IF signal. The signal passes through the MCF (XF100), is amplified by the IF amplifier (Q112) and enters the IF IC (IC100). Then the signal is converted to the 450kHz second IF signal by the second local oscillator, which is tripled 12.8MHz (Lower heterodyne). Then it is detected to generate an audio signal.

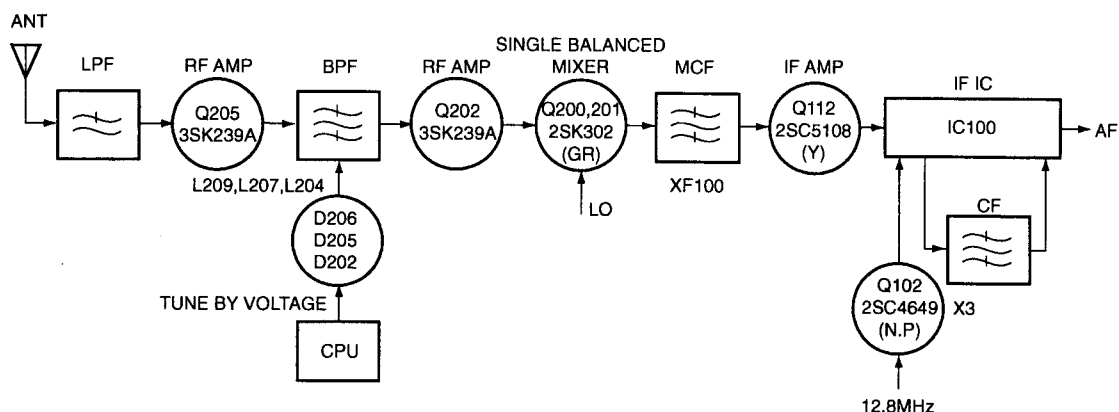

Fig.2 Main VHF Receiver circuit

2-2. Main UHF Receiver

The incoming signal from the antenna passes through a filter circuit and enters the RF amplifier (Q508). The amplified signal passes through the SAW filter (L517), is amplified by another RF amplifier (Q505). Then it passes through the LC filter (L508) and enters the single balanced mixer (Q501, Q502). The frequency of the signal is converted by the first

local oscillator (Lower heterodyne) to generate a 45.05MHz first IF signal. The signal passes through the MCF (XF400), is amplified by the IF amplifier (Q406) and enters the IF IC (IC400). The signal is converted to the 455kHz second IF signal by the second local oscillator (Upper heterodyne). Then it is detected to generate an audio signal.

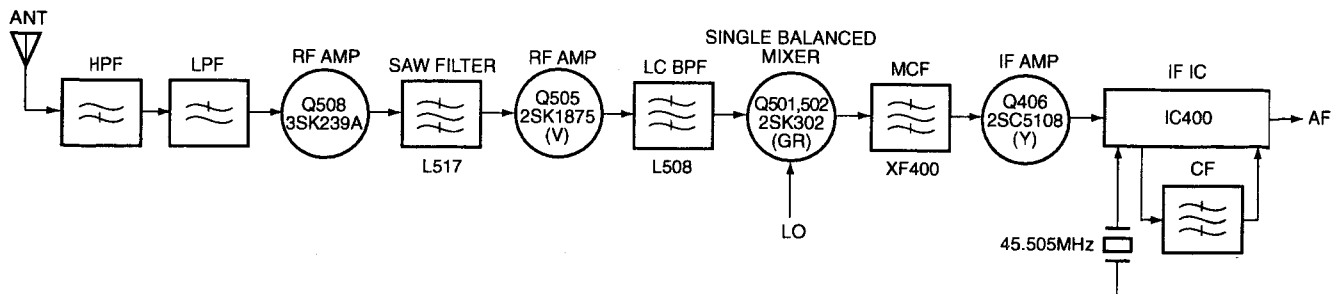

Fig.3 Main UHF Receiver circuit

CIRCUIT DESCRIPTION

2-3.Sub VHF Receiver

The signal distributed from the RF amplifier (Q205) at the main VHF receiver circuit passes through a filter circuit. Then it enters the RF amplifier (Q507). The amplified signal goes to the single balanced mixer (Q501, Q502). The frequency of the signal is converted by the first local oscillator generated by half of the UHF VCO oscillator frequency, using the prescaler (IC303). It converts to the upper heterodyne frequency to

generate a 45.05MHz first IF signal. The signal passes through the MCF (XF400). Then it is amplified by the IF amplifier (Q406), and enters the IF IC (IC400). The signal is converted to the 455kHz second IF signal, using the second local oscillator (Upper heterodyne). Then the signal is detected to generate an audio signal.

Fig.4 Sub VHF Receiver circuit

2-4.Sub UHF Receiver

The signal distributed from the RF amplifier (Q508) at the main UHF receiver circuit passes through a filter circuit. Then it enters the single balanced mixer (Q200, Q201). The signal frequency is converted by the first local oscillator, generated by doubling the VHF VCO oscillator frequency (Lower heterodyne) by Q7, to generate a 38.85MHz first IF signal. The

signal passes through the MCF (XF100). Then it is amplified by the IF amplifier (Q112), and enters the IF IC (IC100). The signal is converted to the 450kHz second IF signal by the second local oscillator generated by tripling the 12.8MHz reference oscillator frequency (Lower heterodyne). Then the signal is detected to generate an audio signal.

TM-D700A/E

CIRCUIT DESCRIPTION

2-5.Audio Circuit

The detected VHF audio signal is amplified by Q108 and de-emphasized by Q110. The UHF audio signal is amplified by Q402 and de-emphasized by Q405. One of these audio signals is selected with a cross point switch (IC702). The signal passes through the electronic variable resistor (IC804), is amplified by the AF amplifier (IC806), and fed to the speaker or the external speaker jack.

The VHF or UHF audio signal selected by the cross point switch, passes through the filter circuit (IC701) and goes to the CPU (IC604) for CTCSS and DCS decoding. The signal buffered by Q701 is output to the PR1 terminal of the DATA connector, and the signal buffered by Q700 is output to the PR9 terminal. The 1200bps and 9600bps packet signals pass

through CN600 from the cross point switch, go to the TNC unit (X52-331). They are used for the TNC circuit. In the X52-331 unit, the 1200bps packet signal is amplified by the AF amplifier (IC7), passes through the audio filter (Q5), and is rectified to a rectangular wave by the comparator (IC4). Then, the reshaped signal goes to the TNC ASIC (IC2). It passes through the filter (Q4, Q7) and the comparator (IC6). Then it goes back to IC2. Then it is converted to digital data and output to the COM terminal at the TNC CPU (IC3). The 9600bps packet signal is amplified by the AF amplifier (IC7), passes through the audio filter (Q6). It is reshaped to a rectangular wave by the comparator (IC4). Then it goes to the TNC ASIC (IC2), converts to digital data and output to the COM terminal at TNC CPU (IC3).

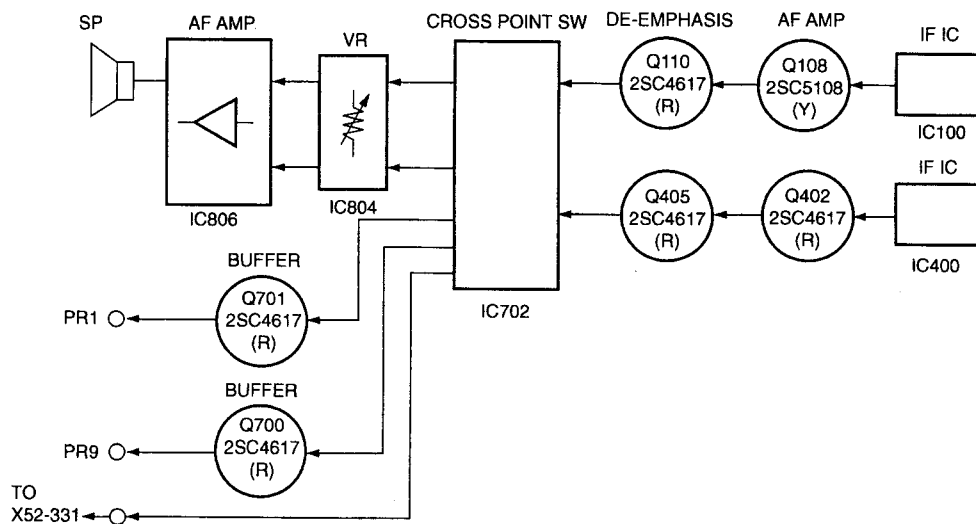

Fig.6 Audio circuit

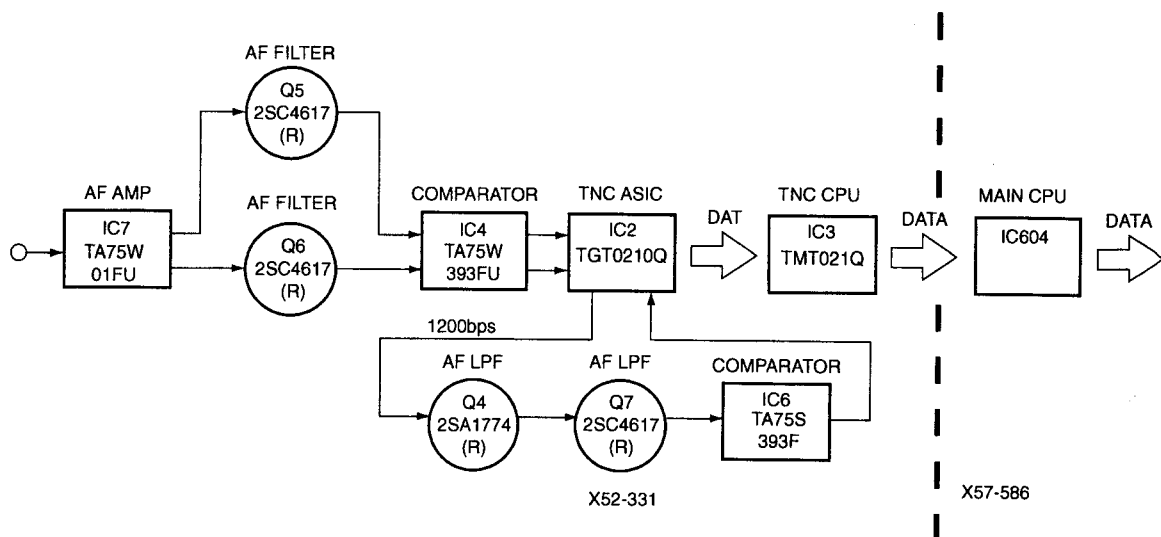

Fig.7 TNC unit circuit

CIRCUIT DESCRIPTION

※ RAV and RAU is de-emphasized audio signal. RDV and RDU is not de-emphasized.

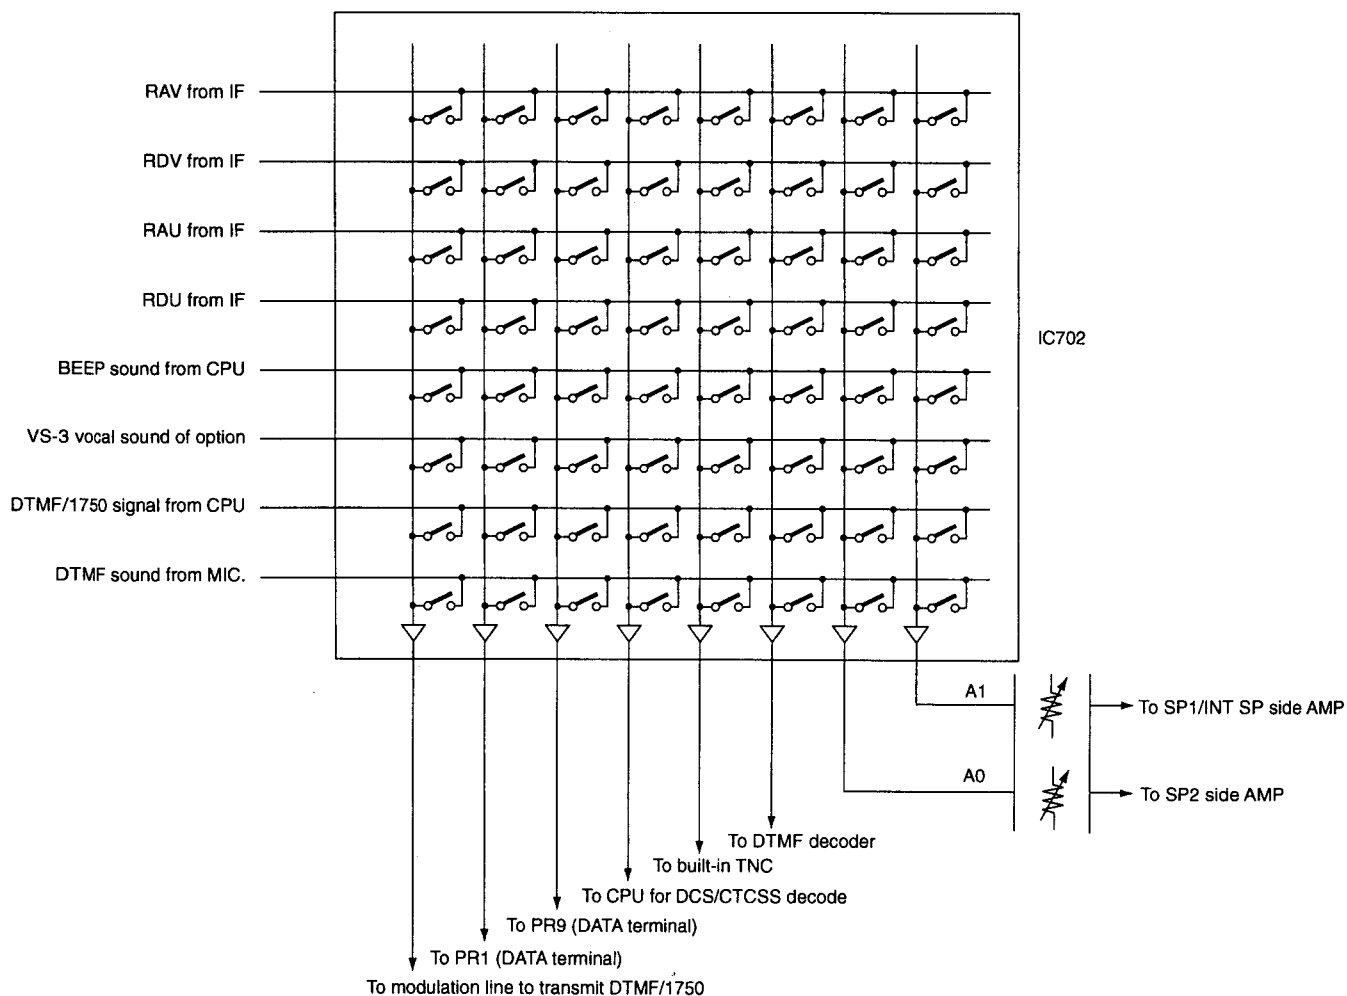

Fig.8 Cross point switch (Audio switching circuit)

TM-D700A/E

CIRCUIT DESCRIPTION

3. Transmitter system

3-1. Modulation Circuit

The audio modulation input from the microphone is amplified by IC801. The 1200bps packet signal generated by the X52-331 goes to IC801. The DTMF signal and 1750Hz tone signal (E type only) generated by the CPU are also mixed by IC801. The modulation signal from the DATA terminal is switched by IC803. It is directed to IC801 in 1200bps mode and to IC802 in 9600bps mode. The signal amplified by IC801 is pre-emphasized by Q801 and Q802, and its level is adjusted

by IC804, and the resulting signal goes to each of the VHF and UHF VCOs as a modulation signal. The TONE/CTCSS/DCS signal generated by the CPU is fed to IC802 in the same way as the 9600bps mode signal from the DATA terminal. The signal amplified by IC802 is distributed and the level is adjusted. The modulating signal goes to each of the VHF and UHF VCOs. The signal is amplified by IC300 and modulates the reference oscillation circuit.

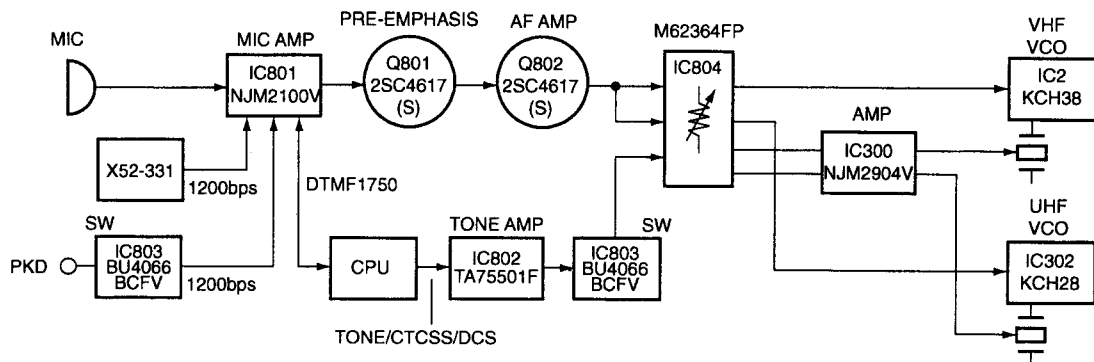

Fig.9 Modulation circuit

3-2. Transmitter circuit

The VHF VCO output is amplified by 3-stage amplifier, RF amplifier (Q6) and driver amplifier (Q8, Q9). It is amplified to the final output by the power module. The signal passes through antenna switch (D14, D15) and low-pass filter and is fed to the antenna.

The UHF VCO output is amplified by 4-stage amplifier, RF amplifier (Q304) and driver amplifier (Q307, Q309, and Q310). It is further amplified to the final output by the power module. The signal passes through antenna switch (D314), low-pass filter and high-pass filter. Then it is fed to the antenna.

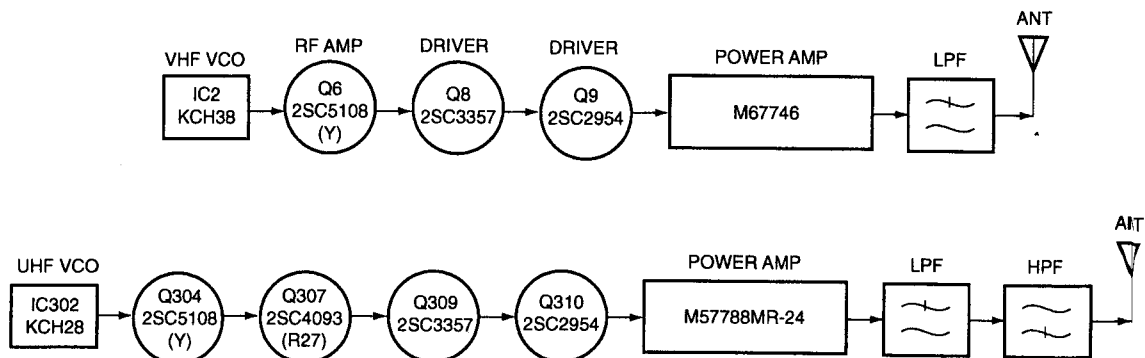

Fig.10 Transmitter circuit

TM-D700A/E

CIRCUIT DESCRIPTION

3-3.APC circuit

The Automatic transmission Power Control(APC) circuit has a differential amplifier (IC200) that compares the DC voltage generated by detecting part of the transmission output using diodes (VHF: D18, D19; UHF: D317, D318) with the reference

voltage output from the CPU. The output signal is amplified by Q209 and Q208 and fed to the power module to keep transmission output constant.

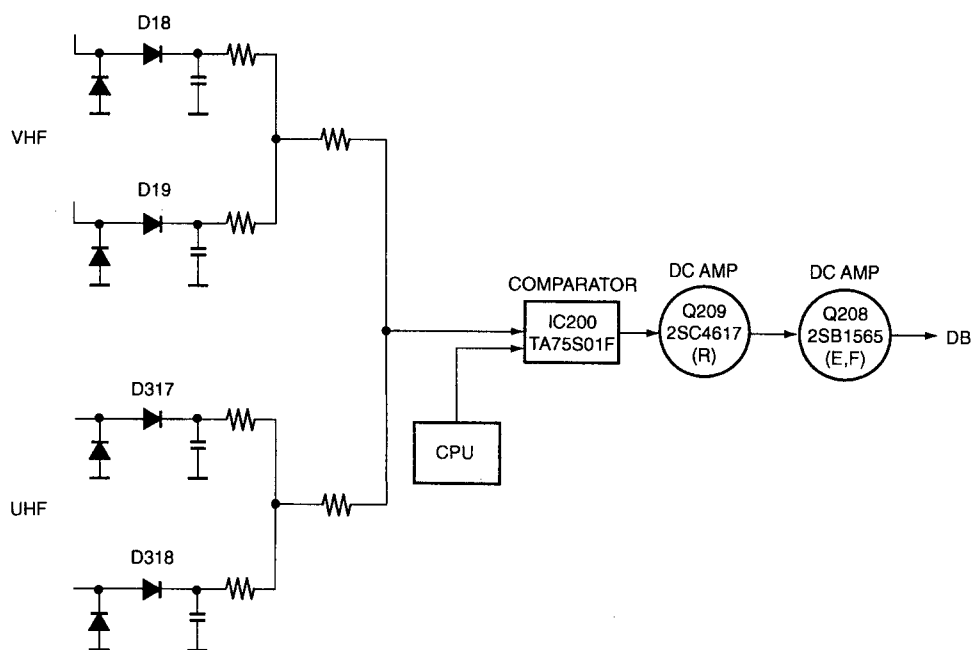

Fig.11 APC circuit

3-4.Overheating protection circuit

To protect from the thermal destruction of the power module, the voltage of the thermistor (TH1) near the power module is monitored by the CPU (IC604). If it becomes high

temperature, the APC voltage is controlled to cool down the temperature.

CIRCUIT DESCRIPTION

4. PLL circuit

4-1. Reference oscillator circuit

The 12.8MHz signal is generated by the crystal oscillator circuit (IC1 and IC301) and internally divided to generate 5kHz or 6.25kHz reference frequency. The 12.8MHz signal on IC1 side is tripled by Q102 to obtain the second local oscillator for the A band. The reference oscillation circuit is also modulated to improve the modulation characteristics of the DCS and 9600bps packet signal when it is transmitted.

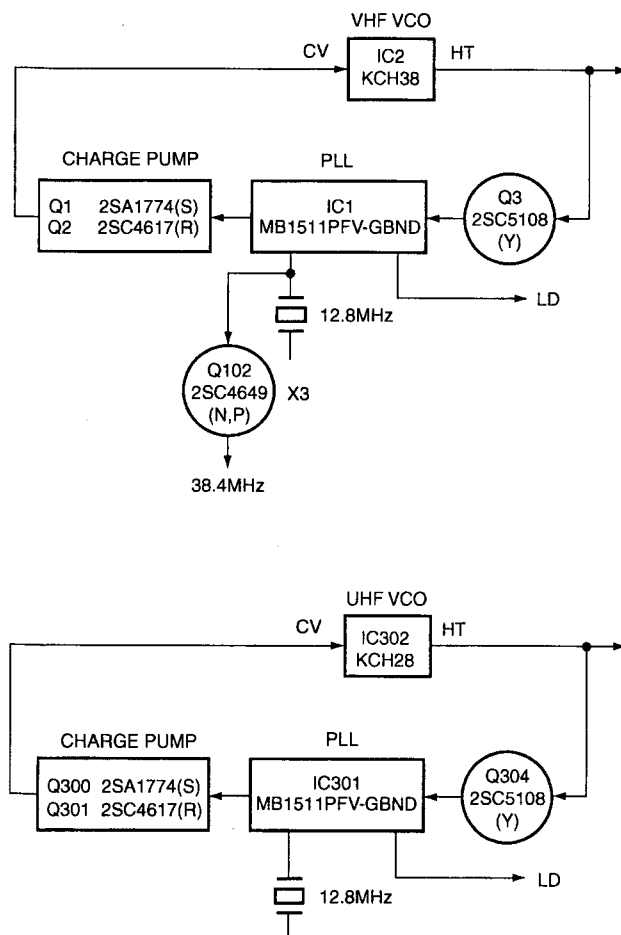

Fig.12 PLL circuit

4-2. Phase comparator

Part of the VHF VCO output is amplified by Q3 and goes to VHF PLL IC. Also, a part of the UHF VCO output is amplified by Q302 and goes to the UHF PLL IC. The pulse-swallow type PLL IC divides the input VCO oscillator frequency using the data from the CPU (IC604). It compares its phase with that of the reference frequency to make the PLL synthesizer to generate the desired step.

4-3. Lock voltage (VCO control voltage)

The phase differential comparator, output from the PLL IC, results in a phase difference pulse. This pulse is amplified by a charge pump (Q1, Q2 or Q300, Q301), the ripples are removed by a low-pass filter. Then the signal is supplied as the oscillator frequency control voltage for each VCO.

4-4. Unlock detection circuit

When the PLL is unlocked, a low state voltage is outputted from pin 8 of the PLL IC.

This signal is monitored by the CPU (IC604) to control transmission/reception switching timing.

5. Power supply circuit

5-1. Microcomputers and peripheral circuits

Reset and backup circuits

The CPU reset signal is generated by detecting a rising edge of the M5C line voltage with the reset IC (IC601). The TNC reset pulse is generated by Q3 at a rising edge of VDD. When the voltage supplied to the transceiver decreases and the B line voltage falls below the detection voltage of the voltage detection circuit (Q604, D604), the CPU (IC604) detects it through the interrupt pin, stores data in the EEPROM (IC602), and shuts the power off.

5-2. Voltage detection processing

The CPU (IC604) monitors and process various voltage status at IC604 A/D ports.

The squelch voltage is input from the IF IC and a change in the noise voltage is detected to control squelch. The S meter voltage is input from the IF IC to control the S meter display. The thermistor voltage (temperature) and the remote control microphone key operation are also detected through the A/D port.

TM-D700A/E

CIRCUIT DESCRIPTION

5-3.Serial control

The CPU (IC604) controls the panel unit (X54-329 unit) through a synchronous serial communication. The CPU (IC604) controls the TNC CPU (IC3: X52-331 unit) through 9600bps serial communication. In APRS mode, settings and transmission data are sent from the CPU (IC604) to the TNC and received packet data is sent from the TNC to the CPU (IC604). In the packet transmission mode, a personal computer is connected with the CPU (IC604) through the RS-232C driver (IC600). The data from the personal computer is received by the CPU (IC604) and transferred to the TNC CPU (IC3). The received packet data is sent from the TNC CPU (IC3) to the main CPU (IC604), which transfers the raw data to the personal computer. In the personal computer control mode, the CPU (IC604) receives and processes data from the personal computer and sends the processed data back to the personal computer.

Fig.13 Structure of non-synchronized serial communication

5-4.Narrow/Wide switching circuit (TM-D700E only)

The receiver band width can be switched between narrow and wide by selecting IF ceramic filters, CF100 (narrow) and CF101 (wide) on the A band with a switching circuit (Q100, Q101, D100, D101). On the B band, the receiver band width can be also switched between narrow and wide by selecting IF ceramic filter CF400 (narrow) and CF401 (wide) with a switching circuit (Q400, Q401, D400, D401).

The transmitter deviation can be switched between narrow and wide by setting the electronic variable resistor (IC804) on the deviation adjustment point. It is controlled from the CPU (IC604).

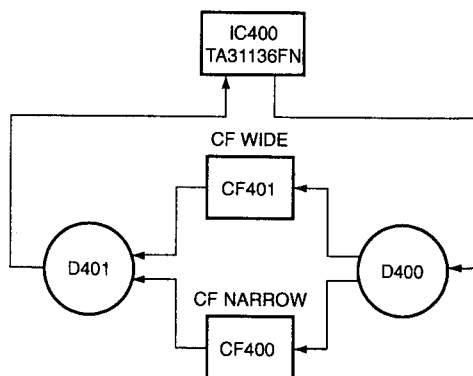

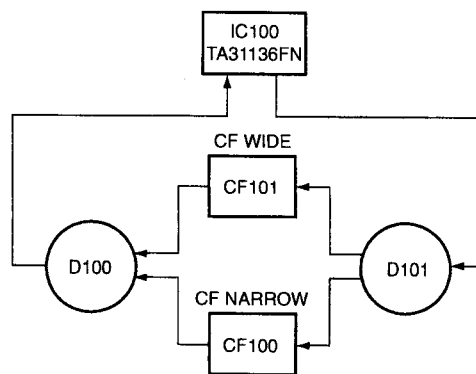

Fig.14 Narrow/Wide Switching circuit

TM-D700A/E

CIRCUIT DESCRIPTION

6. AF Signal System

6-1. Beep circuit and mute circuit

A beep sound is generated by the CPU (IC604) and goes to cross point switch (IC702).

This signal is switched by the cross point switch (IC702) and are input to the electronic volume (IC804). While the beep signal is output from the microprocessor, audio signals for each band are muted by the cross point switch (IC702) with the serial data from the microprocessor (IC604).

The signals output from the electronic volume (IC804) are input to the speaker switching circuit and go through the audio mute circuit (Q804 and Q805). Then it is input to the power amp (IC806).

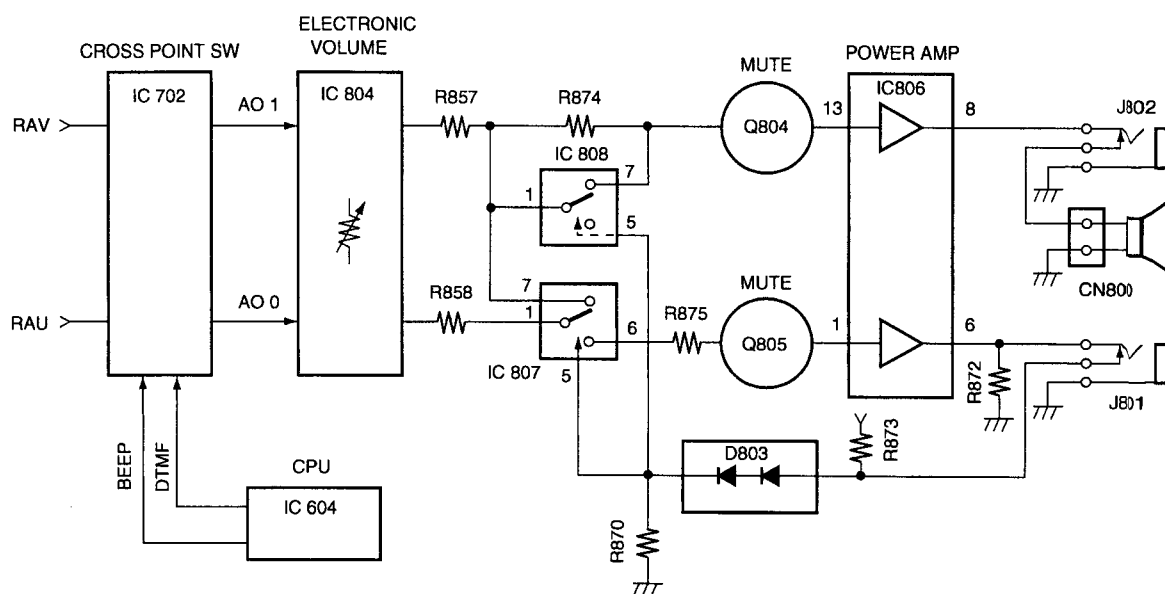

Fig.15 Beep circuit and mute circuit

TM-D700A/E

CIRCUIT DESCRIPTION

6-2. Speaker Switching Circuit

There are two speaker jacks, J801 and J802. The AF signals can be output in various combinations matching the internal speakers.

When no external speaker is connected to J801, Pins 5 of the multiplexer (IC807, IC808) go low, the AF signals AO 0 and AO 1 are added and input to the power amp (IC806).

When an external speaker is connected to J801, Pins 5 of the multiplexer (IC18) go high and AO 0 and AO 1 are input separately to the power amp.

The AF signal output combinations are as in the speaker combination table on the below.

	AO 1	AO 0
Internal speakers only	Internal speaker	
1 external speaker (J802)	external speaker	
1 external speaker (J801)	Internal speaker	external speaker
2 external speaker	external speaker	external speaker

Table7 Speaker combination table

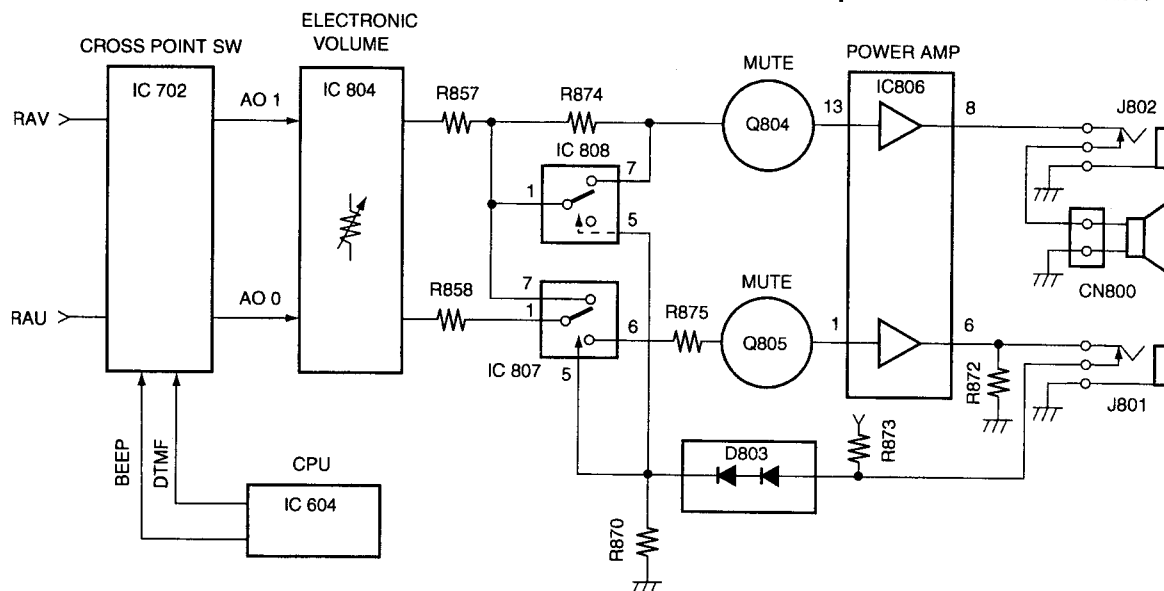

Fig.16 Speaker switching circuit

6-3. Microphone Key Input

The microphone UP/DOWN and function keys are connected to the microprocessor analog input. The voltage when a key is ON operates the corresponding function. Also, the key input interrupt circuit is for switching the power ON/OFF with the microphone. When the DOWN, MR, and PF keys are

pressed, an interrupt is generated and the microprocessor is awoken from stop mode. However, with the TM-D700A/E, the power ON/OFF switch function can be registered to the PF key on the microphone.

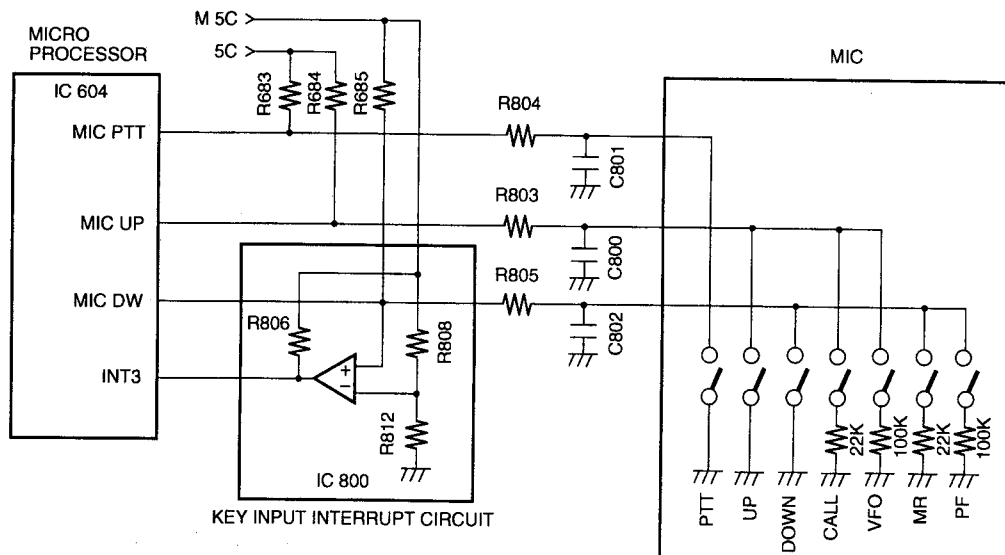

Fig.17 Microphone key input circuit

TM-D700A/E

CIRCUIT DESCRIPTION

7. Data Terminal and Peripheral Circuits

J700 (data terminal) is the data communications terminal on the front. It handles transmission control, data input/output, and squelch signals.

There are two data communications modes: 9600bps mode and 1200bps mode. 9600bps mode communications are FAST FM mode of SSTV, GMSK and G3RUH packet communications. Unlike with 1200bps AFSK, with this type of high-speed modulation, frequency modulation is carried out after the digital base band signals (rectangular wave) are passed through a band limiting filter. For 9600bps GMSK for example, compared to 4800Hz signals (nearly sine wave signals passed through a filter), these signals have a hissing sound like digital modulation when listened to by ear. Different

types of modulation, such as GMSK and G3RUH, are distinguished by the type of band limiting filter.

Pin No.	Pin name	Specification		
1	PKD	bps switching	1200bps	9600bps
		Modulation input	40mVp-p	2Vp-p
		Frequency shift	3±0.5kHz	2.2±0.5kHz
4	PR9	Output level 500mVp-p/10kΩ Always output during reception		
5	PR1	Output level 500mVp-p/10kΩ Not output when squelch off		

Table8 DATA terminal input/output level

7-1. Transmission signals

Transmission modulation signals enter from PKD of the data terminals (J700). The path to the modulation depends on whether communications are 1200bps or 9600bps mode.

For 1200bps mode, the transmission modulation signals pass through the analog switch (IC803), and are input to IC801 (Pin 6). The signals pass through the pre-emphasis (Q801, Q802), are adjusted by the electronic volume, and are input to the VCO.

For 9600bps mode, the transmission modulation signals pass through IC803 and amplified by the tone amp (IC802). Then it is adjusted by the electronic volume, and are input to the VCO.

The frequency shift depends on the input signal level, so there is an amplitude limiting circuit (D702, D703) to hold the signal below 4 Vp-p to avoid extreme shifts. Thanks to this circuit, the PKD signal does not go above 4 Vp-p and the frequency shift does not fluctuate extremely.

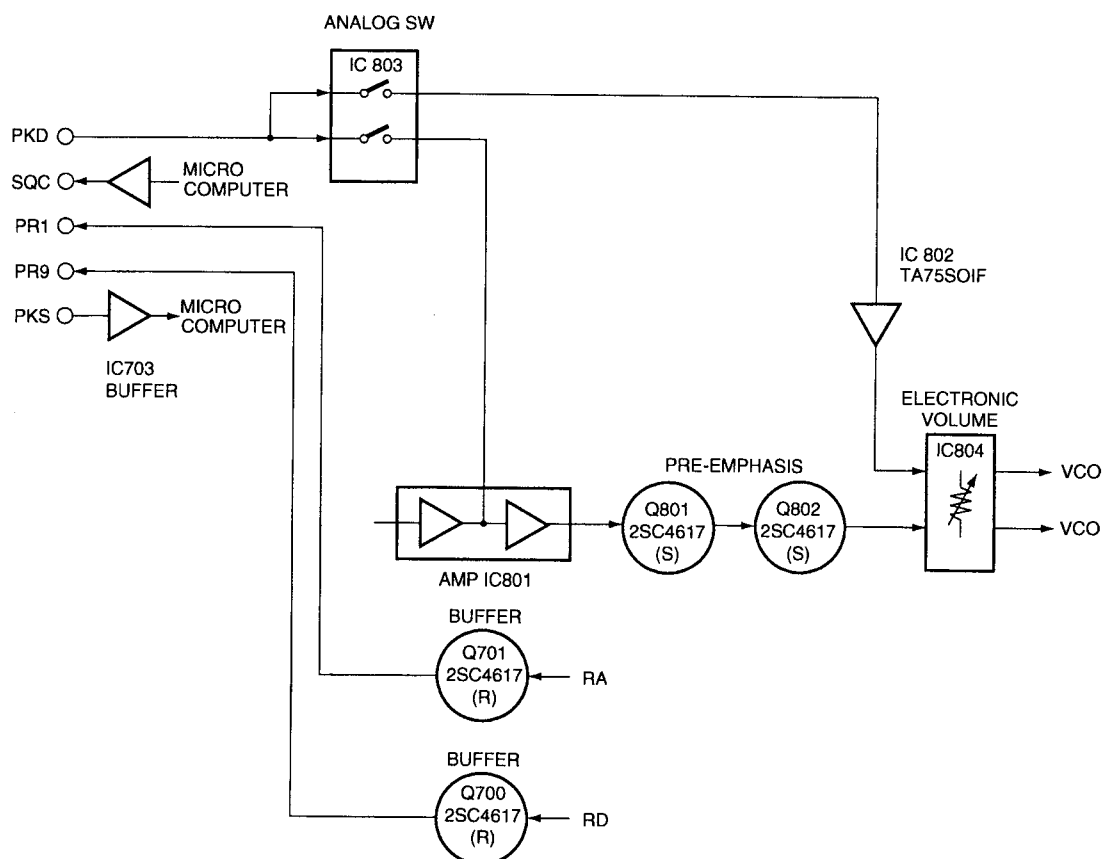

Fig.18 Transmission signals

TM-D700A/E

CIRCUIT DESCRIPTION

7-2. Reception signals

PR9 is the 9600bps data communications reception output. It outputs the FM detection circuit output (RD signals) through a buffer amp (Q700). These signals are always output whether the squelch is open or closed.

PR1 is the 1200bps data communications reception output. It outputs the FM detection circuit output (RA signals) through a buffer amp (Q701). Output is controlled with the cross point switch (IC702) according to whether squelch is open or closed.

7-3. Squelch signal output circuit

The squelch circuit is input to the TNC to prevent conflicts from occurring between simultaneous receive mode and transmit mode traffic during packet communications. (only during 1200bps) The signal is output from Pin 15 of IC703 to the data terminal. The logic is as shown in the Table below.

SQC terminal output (J700 Pin 6)	L : SQ CLOSE H : SQ BUSY
-------------------------------------	-----------------------------

8. Panel Section (LCD ASSY: B38-0829-05)

The panel section controls serial communications with the main unit control section, the key input circuit, the display circuit, and the dimmer circuit through the microprocessor (IC4).

8-1. Serial communications circuit

A buffer amp is inserted in order to protect the microprocessor ports.

8-2. Key, Volume input circuit

Circuits to operate the panel section keys are connected to each microprocessor port. The PSW key is pulled up and the other keys are pulled up with software within the microprocessor. Rotary encoder operating circuits are connected directly to the microprocessor. The control divides the power supply voltage, reads the A/D port of the microprocessor, and transfers that data to the main unit.

8-3. Display circuit

The TM-D700A/E display section is a 188x54-dot full-dot matrix LCD controlled by two LCD. As shown in Figure 19, the master IC (IC2) side is connected to 22 common dots and 88 segment dots and the slave IC (IC1) side is connected to 33 common dots and 100 segment dots. The LCD drive voltage is obtained by raising the power supply voltage (5V) within the IC.

Fig.19 Display circuit

8-4. Dimmer circuit

The dimmer circuit switches the lamp brightness to one of four levels or OFF. (See table) The current flowing to the LEDs is varied by selecting resistors from R8 to R14.

Dimmer level	DIM 0	DIM 1	DIM 2	DIM 3
1	H	L	L	L
2	L	H	L	L
3	L	L	H	L
4	L	L	L	H
OFF	L	L	L	L

PACKING

ADJUSTMENT

Measuring Equipment for Adjustment

1. **Digital voltmeter (D.V.M)**
Input impedance: High
2. **RF valve voltmeter (RF V.M)**
Input impedance: $1\text{M}\Omega$ or more, 2 pF or less
Voltage range: Full scale = 10mV to 300V
Measurable frequency range: up to 450MHz
3. **Frequency counter (f. counter)**
Input sensitivity: About 50mV
Measurable frequency: 450MHz or more
4. **DC power supply**
Voltage: Variable in the range 10 to 17V
Current: 13A or more
5. **Power meter**
Measurement power: 60W, 30W, 10W
Impedance: 50Ω
Measurable frequency: 450MHz
6. **AF valve voltmeter (AF V.M)**
Input impedance: $1\text{M}\Omega$ or more
Voltage range: Full scale = 1mV to 30 V
Measurable frequency range: 50Hz to 10kHz
7. **AF generator (AG)**
Output frequency: 100Hz to 10kHz
Output voltage: 0.5mV to 1V
8. **Line detector**
Measurable frequency: 450MHz
9. **Spectrum analyzer**
Measurable frequency: 450MHz
10. **Directional coupler**
11. **Oscilloscope**
High sensitivity with horizontal input terminal
12. **Standard signal generator (SSG)**
The standard signal generator must be able to generate the 1GHz band frequencies and vary the amplitude and frequency.
Output: -133dBm to greater than -13dBm
13. **Dummy load (for AF)**
 8Ω , about 5W
14. **Noise generator**
The noise generator must be able to generate noise similar to ignition noise containing high-frequency components of 450MHz or more.
15. **Sweep generator**
The sweep generator must be able to sweep the 144 and 430MHz bands.
16. **Tracking generator**
17. **Adjustment jig**

Preparation

- Set the controls and switches to the positions listed below unless otherwise specified.

VOL control	Fully counterclockwise
SQL control	Fully counterclockwise
POWER switch	OFF
(For fixed stations)	OFF
DC power supply POWER switch	

Microphone socket
(as viewed from the front of the set)

- Use an insulated rod, such as a plastic rod, for adjustment (especially for trimmers, coils, etc.).
- To protect the signal generator, never connect the microphone to the microphone socket when the receiver section is adjusted.
- Before the power cord is connected, make sure the power switch is off.
- Without specification of SSG, standard modulation is applied (MOD : 1kHz, DEV : $\pm 3\text{kHz}$, AF output : 0.63V / 8Ω)
- See the instruction manual for transmit and receive operations.

TM-D700A/E

ADJUSTMENT

Internal clock resetting

If the following operations are performed, the clock (TNC unit IC1) in the transceiver must be reset. Reset the clock as follows. (If it is not reset, the clock does not count correctly.)

1. Replace the lithium battery (BA600: W09-0570-05) installed in the TX-RX unit (X57-586X-XX).
2. Disconnect the flat cable (E37-0840-05) between the TX-RX unit (X57-586X-XX) and TNC unit (X52-3310-00).

Procedure for resetting the internal clock

1. Hold down the [F3] and [F4] keys and turn [PWR] ON.
2. The frequency display screen appears. (The screen is the same as the one that is displayed when the power is normally turned on, but the internal clock is reset to "January 1, 2000, 00:00:00".)

Checking the time and date after resetting

1. Time
 - (1) Press the [MNU] key to enter menu mode.
 - (2) Select menu number 1 (RADIO) on the left side with the encoder and press [OK].
 - (3) Select menu number 6 (TNC) at the center with the encoder and press [OK].
 - (4) When menu number 3 (TIME) on the right side is selected with the encoder and [OK] is pressed, the time setting mode is entered and a check can be made to see whether the time is "00:00". (See the figure below.)

2. Data

- (1) Press the [MNU] key to enter menu mode.
- (2) Select menu number 1 (RADIO) on the left side with the encoder and press [OK].
- (3) Select menu number 6 (TNC) at the center with the encoder and press [OK].
- (4) When menu number 4 (DATE) on the right side is selected with the encoder and [OK] is pressed, the date setting mode is entered and a check can be made to see whether the date is set to "00-01-01" (January 1, 2000). (See the figure below.)

Note: The order of year, month, and day in the date format is different according to destinations.

K destination : Month-day-year
M4, E destination : Day-Month-year

ADJUSTMENT

Adjustment Service Jig

Data terminal short plug (W05-0611-00)

●Service jigs usage

Pin assignment seen from direction B

Short plug
Terminals ③ and ⑥ are short circuited.

[Reference] ③ PKS (SEND switch for DATA terminal)
Connect PTT output. If PKS is set to "L",
data are sent and the microphone will be mute.
⑥ SQC (Squelch control output)
This outputs squelch control output.

●Service jigs specification

Plug cable with 6P mini-DIN : Model PG-5A (cable parts No. : E30-3202-05) processed like under fig.

Pin assignment seen from direction A

DIN pin No.	Color
1	Brown
2	Red
(3)	Orange
4	Yellow
5	Green
(6)	Blue
Bracket	Shield

Join these DIN pins.

Cut unnecessary wires
at the bottom and wind
insulation tape around
top edge.

- L207 : BPF (VHF)
- L209 : BPF (VHF)
- L102 : AF distortion (VHF)
- L200 : AF distortion (VHF)
- L401 : AF distortion (UHF)
- L500 : AF distortion (UHF)

● Test point SMV : BPF

ADJUSTMENT

Adjustment mode

- This is the adjustment mode for making adjustments or setting levels.
- The following items can be adjusted or set.
 - A. Squelch open sensitivity
 - B. S meter (the first segment ON, all segments ON)
 - C. Transmission output power (lower limit frequency, center frequency, and upper limit frequency of the band)
 - D. Transmission deviation
 - E. DCS modulation balance
 - F. Tone deviation
 - G. DCS deviation

Adjustment mode startup method

1. Turn [PWR] OFF and insert the adjustment plug into the data terminal of the transceiver.
2. Hold down the [F] and [TONE] keys, and turn [PWR] ON.
3. The transceiver will enter the adjustment mode and display the following:

4. In adjustment mode, the desired band and frequency can be selected with [VFO], [MR], [ENCODER], [MHZ], and [BAND SEL].
5. Pressing the [←] or [→] key switches the adjustment item to the previous item or the next item among the seven adjustment items A-G.

A. Squelch open sensitivity (value set for each band)

1. Press the [←] and [→] keys to display "SQUELCH".
The current squelch level input value is displayed on the screen and adjustment can be performed. (See the figure below.)

2. When specified SSG input is applied to the antenna connector and the [SET] key is pressed, an adjustment value is set.

B. S meter (value set for each band)

1. Press the [←] and [→] keys to display "S METER".
The current S meter input value is displayed on the screen and adjustment can be performed. (See the figure below.)

2. S meter (the first segment ON)
When specified SSG input applied to the antenna connector and the [S1] key is pressed, a value is set so that the first segment of the S meter turns on.
3. S meter (all segments ON)
When specified SSG input applied to the antenna connector and the [S7] key is pressed, a value is set so that the all segment of the S meter turns on.

C. Transmission output power (values set independently for 144MHz and 430MHz)

1. Press the [←] and [→] keys to display "APC".
The current transmission output power setting is displayed on the screen. (See the figure below.)

2. Select a desired transmission output range (HI, MID, or LOW) with the [LOW] key.
3. Connect the power meter to the antenna connector. Connect a microphone to the microphone connector.
4. Lower limit frequency transmission output setting.
 - (1) Set the lower limit frequency and press the microphone PTT button to enter transmit mode.
 - (2) Adjust the power meter to the prescribed transmission power by turning the encoder.
 - (3) When the specified transmission power value is reached, release the microphone PTT button and press the [FREQ1] key to set the adjustment value.
5. Center frequency transmission output setting.
 - (1) Set the center limit frequency and press the microphone PTT button to enter transmit mode.
 - (2) Adjust the power meter to the prescribed transmission power by turning the encoder.
 - (3) When the specified transmission power value is reached, release the microphone PTT button and press the [FREQ2] key to set the adjustment value.

ADJUSTMENT

6. Upper limit frequency transmission output setting.

- (1) Set the upper limit frequency and press the microphone PTT button to enter transmit mode.
- (2) Adjust the power meter to the prescribed transmission power by turning the encoder.
- (3) When the specified transmission power value is reached, release the microphone PTT button and press the [FREQ3] key to set the adjustment value.

D. Transmission deviation

(values set independently for 144MHz and 430MHz)

1. Press the [←] and [→] keys to display "MAX DEV". The current transmission deviation setting is display on the screen. (See the figure below.)

2. Connect the direct wave detector and power meter to the ANT terminal, apply the prescribed A.G. input from the MIC input terminal, and transmit. Turn the [ENCODER] knob to adjust the direct wave detector reading to the prescribed value.
3. When the prescribed value is reached, stop transmission and press the [SET] key to set the adjustment value.

E. DCS modulation balance (values set independently for 144MHz and 430MHz)

1. Press the [←] and [→] keys to display "DCS BALANCE". The current DCS modulation balance setting is display on the screen. (See the figure below.)

2. Connect the linear detector and oscilloscope to the antenna connector. Connect a microphone to the microphone connector.
3. When the microphone PTT button is pressed to enter transmit mode, 50Hz square waves are internally generated and modulated.
4. While observing the oscilloscope, turn the encoder to adjust the DCS modulation waveform to square waveform.
5. When the DCS modulation waveform becomes square waveform, release the microphone PTT button and press the [SET] key to set the adjustment value.

F. Tone deviation (values set independently for 144MHz and 430MHz)

1. Press the [←] and [→] keys to display "TONE DEV". The current Tone deviation setting is display on the screen. (See the figure below.)

2. Connect the linear detector and oscilloscope to the antenna connector. Connect a microphone to the microphone connector.
3. When the [T.SEL] key is pressed, the tone frequency setting mode is entered, so set a tone frequency to be adjusted by turning the encoder.
4. The microphone PTT button is pressed to enter transmit mode.
5. Connect the direct wave detector and power meter to the ANT terminal, apply the prescribed A.G. input from the MIC input terminal, and transmit. Turn the [ENCODER] knob to adjust the direct wave detector reading to the prescribed value.
6. When the prescribed value is reached, stop transmission and press the [SET] key to set the adjustment value.

G. DCS deviation (values set independently for 144MHz and 430MHz)

1. Press the [←] and [→] keys to display "DCS DEV". The current DCS deviation setting is display on the screen. (See the figure below.)

2. Connect the linear detector and oscilloscope to the antenna connector. Connect a microphone to the microphone connector.
3. When the [T.SEL] key is pressed, the tone frequency setting mode is entered, so set a tone frequency to be adjusted by turning the encoder.
4. The microphone PTT button is pressed to enter transmit mode.
5. Connect the direct wave detector and power meter to the ANT terminal, apply the prescribed A.G. input from the MIC input terminal, and transmit. Turn the [ENCODER] knob to adjust the direct wave detector reading to the prescribed value.
6. When the prescribed value is reached, stop transmission and press the [SET] key to set the adjustment value.

Note: To end adjustment mode, switch off the power.

LEVEL DIAGRAM

Transmitter Section

Note1: Set the AG so that the microphone socket input is 3kHz deviation at 1kHz modulation.

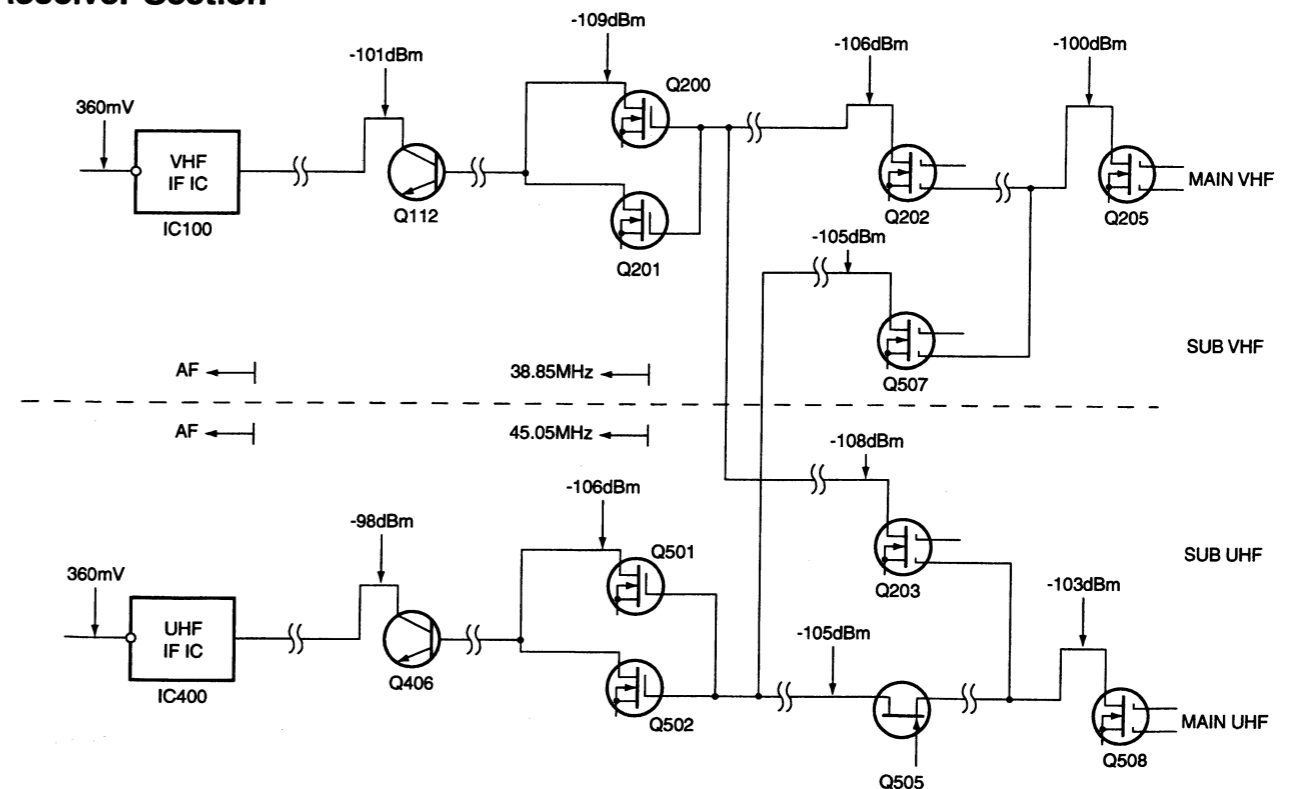

The data communication connector input level is 3kHz deviation at 1kHz modulation for 1200bps and 2kHz deviation at 1kHz modulation for 9600bps.

Note2: The transmit frequency is 145.0 or 435.0MHz.

Note3: The HI/MID/LOW switch is set to HI.

Note4: The measurements with the power meter, except for the ANT connector, are the values with the APC off.

Receiver Section

Note1: The 12dB SINAD levels were plotted using a standard signal generator through a 0.01 μ F ceramic capacitor at each point from the RF to the first IF.

Note2: The AF levels were measured with an AF voltmeter when the -73dBm (50 μ V) standard signal generator signal modulated by a 1kHz modulation frequency and a 3kHz deviation was received and the AF output was adjusted to 0.63V/8 Ω by the AF VR.

OPTION PG-4X (Extension cable kit)

PG-4X MAIN PARTS LIST

Ref. No	New Parts	Parts No.	Q'ty	Parts Name
1		E30-3199-05	1	DC CORD (6m)
2	*	E30-3394-05	1	MODULAR CABLE (4m:MIC)
3	*	E30-3395-05	1	MODULAR CABLE (4m:PANEL)
4	*	E30-3399-05	1	TRUNK CABLE (4m:SP)
5	*	E58-0472-05	1	MODULAR JACK (6 PIN)
6	*	E58-0473-05	1	MODULAR JACK (8 PIN)
7		G13-0978-04	1	CUSHION
8		J19-1433-05	2	HOLDER
9		L79-1417-05	2	LINE FILTER
10	*	N99-2016-05	1	SCREW SET

TM-D700A/E SPECIFICATIONS

Specifications are subject to change without notice due to advancements in technology.

General			VHF Band	UHF Band
Frequency range	U.S.A/Canada		144~148MHz	438~450MHz
	Taiwan		144~146MHz	430~440MHz
	Europe		144~146MHz	430~440MHz
Mode			F3E (FM), F2D (FSK), F1D (GMSK)	
Antenna impedance			50Ω	
Usable temperature range			-20°C ~ +60°C (-4°F~ +140°F)	
Power supply			13.8V DC ±15%(11.7~15.8V)	
Grounding method			Negative ground	
Current	U.S.A/Canada	Transmit (max.)	11.5A or less	10.0A or less
	Europe	Receive (at 2W output)	1.0A or less	
	Taiwan	Transmit (max.)	8.5A or less	9.0A or less
		Receive (at 2W output)	1.0A or less	
Frequency stability(-10°C ~ +50°C)			Within ± 3ppm	
Dimensions	Main Body		140 × 41 × 195mm / 5.51" × 1.61" × 7.68"	
(W × H × D projections included)	Panel		140 × 60 × 49.3mm / 5.51" × 2.36" × 1.94"	
Weight	Main Body		Approx.1.2kg/2.61b	
	Panel		Approx.180g/0.391b	
Transmitter				
Power output	Hight	U.S.A/Canada	50W	35W
		Europe		
		Taiwan	25W	25W
	Mid	Approx.10W		
	Low	Approx.5W		
Modulation			Reactance	
Spurious emissions			-60dB or less	
Maximum frequency deviation	U.S.A/Canada		± 5kHz	
	Taiwan			
	Europe		± 5kHz (Wide), ± 2.5kHz (Narrow)	
Audio distortion (at 60% modulation)			3% or less	
Microphone impedance			600Ω	
Receiver				
Circuitry			Double conversion	
Intermediate frequency (1st/2nd)			38.85MHz/450kHz	45.05MHz/455kHz
Sensitivity (12dB SINAD)	VHF or UHF band		0.16μV or less	
	Sub VHF or UHF band (in VHF/VHF or UHF/UHF mode)		0.25μV or less	
Selectivity (-6dB)	U.S.A/Canada		12kHz or more	
	Taiwan			
	Europe		12kHz or more (Wide), 6kHz or more (Narrow)	
Selectivity (-40dB)	U.S.A/Canada		28kHz or less	
	Taiwan			
	Europe		28kHz or less (Wide), 15kHz or less (Narrow)	
Squelch sensitivity			0.1μV or less	
Audio output (8 ohms, 5%distortion)			2W or higher	
Audio output impedance			8Ω	

Note: Receiver specifications apply only when using the main VHF or UHF band. They do not apply to the sub VHF or UHF band in VHF/VHF or UHF/UHF mode.
